# THREAT ADVISORY

## ATTACK REPORT

### Knocking the Surface of Rhysida Ransomware

Date of Publication

August 10, 2023

Last Update Date

November 16, 2023

Admiralty Code

A1

TA Number

TA2023329

# Summary

**First Seen:** May 17, 2023

**Malware:** Rhysida Ransomware

**Attack Region:** Israel, Kuwait, United States, Brazil, Dominican Republic, Australia, Denmark, Italy, Argentina, Indonesia, Mexico, France, Iran, United Kingdom, Spain, Germany, Martinique, Switzerland, Kenya, Austria, Netherlands, Chile, Lebanon, Singapore, India, Western Europe, North and South America

**Targeted Sectors:** Consumer Services, Healthcare, Education, Government, IT Services, Construction, Engineering, Electrical Equipment, Industrial Conglomerates, Media, Food Products, Transportation, Professional Services, Aerospace, Defense, Manufacturing, Insurance, Banking, Retail, and Technology

**Attack:** The Rhysida ransomware campaign is rapidly gaining notoriety, driven by a series of successful infiltrations into various sectors. Employing an array of dissemination techniques such as Cobalt Strike, phishing campaigns, and a victim assistance chat platform accessible via TOR.

## ☒ Attack Regions

## ⚙️ CVEs

CVE	NAME	AFFECTED PRODUCT	ZERO-DAY	CISA KEV	PATCH
CVE-2020-1472	Microsoft Netlogon Privilege Escalation Vulnerability (Zerologon)	Microsoft Netlogon	✖️	✓	✓

# Attack Details

#1

The Rhysida ransomware-as-a-service (RaaS) emerged in May 2023, in parallel with the launch of their victim assistance chat platform, accessible via the TOR network (.onion). Rhysida disseminated via various channels, with notable methods including distribution via Cobalt Strike or similar frameworks, as well as execution through meticulously organized phishing campaigns. Rhysida has been observed exploiting Zerologon, a critical vulnerability that facilitates the elevation of privileges within Microsoft's Netlogon Remote Protocol.

#2

Notably, Rhysida has initiated a series of targeted attacks against healthcare and public health organizations. When initiated, the Rhysida ransomware displays a cmd.exe interface while meticulously searching all data on local discs. Rhysida, who only facilitates transactions in BTC (Bitcoin), offers victims detailed instructions on how to acquire and use BTC via a dedicated victim webpage. Rhysida is a 64-bit Portable Executable (PE) Windows cryptographic ransomware executable that was painstakingly developed using the MINGW/GCC toolchain.

#3

This ransom note deviates from the norm, foregoing the standard blatant ransom ultimatum found in the majority of ransom notes linked with other malware lineages. The Rhysida ransom letter, on the other hand, takes the form of an alert distributed by the Rhysida "cybersecurity team," informing victims of their compromised system status and the subsequent encryption of their information.

#4

The ransom demand takes the form of a "distinctive key," carefully created to restore encrypted files, the acquisition of which involves payment by the victim. Aside from technical ressembles such as the deployment of NTDSUtil, the implementation of local firewall regulations to facilitate C2 communications via SystemBC, and the adoption of the PortStarter utility—a tool primarily associated with [Vice Society](#)—another noteworthy aspect is the correlation between the emergence of Rhysida and a significant decline in Vice Society operations.

#5

The Kuwaiti government fell victim to a targeted Rhysida ransomware attack on its Ministry of Finance. The cyber attack commenced on September 18, 2023, and the hacking group publicized their success on their leaked website on September 25, 2023. The disclosed information includes crucial state property management records, such as agreements for chalet rentals, land rental contracts, and both current and expired civil identification cards, tallying up to 464GB of data. This signifies the successful infiltration of the government organization's intricate systems by the hacking group.

#6

The auction for this stolen data is starting with a substantial initial price of 15BTC, equivalent to approximately \$400,000. Notably, the individuals behind the Rhysida ransomware have implemented a dedicated form on their website, allowing potential clients to provide their email addresses and state their bidding prices. This gutsy move underscores the increasing boldness of cybercriminals, who are progressively resorting to extortion as a means to achieve financial gains.

## Recommendations

Create an inventory of assets and data. Examine the event and incident records thoroughly. Supervise hardware and software configurations. Allocate administrative powers and access exclusively based on a privilege. Set strict security parameters for network infrastructure devices such as firewalls and routers. Create a software whitelist to only allow legitimate applications.

Implement frequent backups for all assets to ensure their complete safety. Implement the 3-2-1-1 backup structure and use specialized tools to provide backup resilience and accessibility.

Prioritize system patching to address the CVE-2020-1472 vulnerability (ZeroLogon) and prevent unauthorized access. Implement network segmentation to contain potential breaches and restrict lateral movement.
