**ATTACK REPORT**

Moonstone Sleet: A New North Korean Cyber Threat

Date of Publication

May 29, 2024

Admiralty Code

A1

TA Number

TA2024211

Summary

First Seen: January 2024

Targeted Regions: Worldwide

Malware: FakePenny Ransomware

Threat Actor: Moonstone Sleet (aka Storm-1789)

Targeted Industries: Information technology, Education, and Defense

Attack: Moonstone Sleet, a newly discovered North Korean hacking group, targets companies for financial gain and stealing information. They use a mix of common tactics like fake companies and trojanized software, alongside unique methods like creating malicious games, custom ransomware. This well-resourced group is likely to become even more sophisticated in the future.

Attack Details

#1

A new North Korean threat actor named Moonstone Sleet, previously known as Storm-1789, which utilizes a blend of traditional techniques used by other North Korean groups along with unique attack methods to target companies for financial gain and cyberespionage.

#2

Moonstone Sleet has been observed setting up fake companies and job opportunities to engage potential victims, deploying trojanized versions of legitimate tools such as PuTTY, creating a malicious game, and delivering a new custom ransomware called FakePenny.

#3

Initially, Moonstone Sleet's operations overlapped with those of another North Korean threat actor, Diamond Sleet, but it has since established its own infrastructure and attack strategies, distinguishing itself as a separate and formidable entity.

#4

The group's tactics include distributing trojanized software through social media and freelancing platforms, creating fake companies like StarGlow Ventures and C.C. Waterfall to approach targets with collaboration offers, and pursuing legitimate software development jobs to infiltrate organizations.

#5

Moonstone Sleet employs multi-stage malware delivery processes and leverages malicious npm packages through freelancing websites and social media platforms to target individuals and organizations in the software, IT, education, and defense sectors. As Moonstone Sleet evolves, it underscores the persistent and sophisticated nature of cyber threats emanating from state-aligned actors.

Recommendations

Enhance Email Security: Deploy advanced email filtering solutions to detect and block phishing attempts and malware attachments before they reach users' inboxes. Additionally, enable multi-factor authentication (MFA) for email accounts to add an extra layer of security.

Implement Endpoint Protection: Deploy comprehensive endpoint protection platforms (EPP) that include behavior analysis and real-time threat detection capabilities. Ensure all systems and software are kept up-to-date with the latest security patches.

Application Whitelisting: Use application whitelisting to ensure that only approved applications and software can execute on systems. This helps prevent trojanized versions of legitimate tools from running.

Network Segmentation and Access Control: Segment networks to limit the lateral movement of attackers. Implement robust access control policies to restrict user access to only necessary resources, based on the principle of least privilege.
