ATTACK REPORT

Operation GhostChat and PhantomPrayers Breach Tibetan Trust

Date of Publication

July 29, 2025

Admiralty Code

A1

TA Number

TA2025234

Summary

Attack Discovered: June 2025

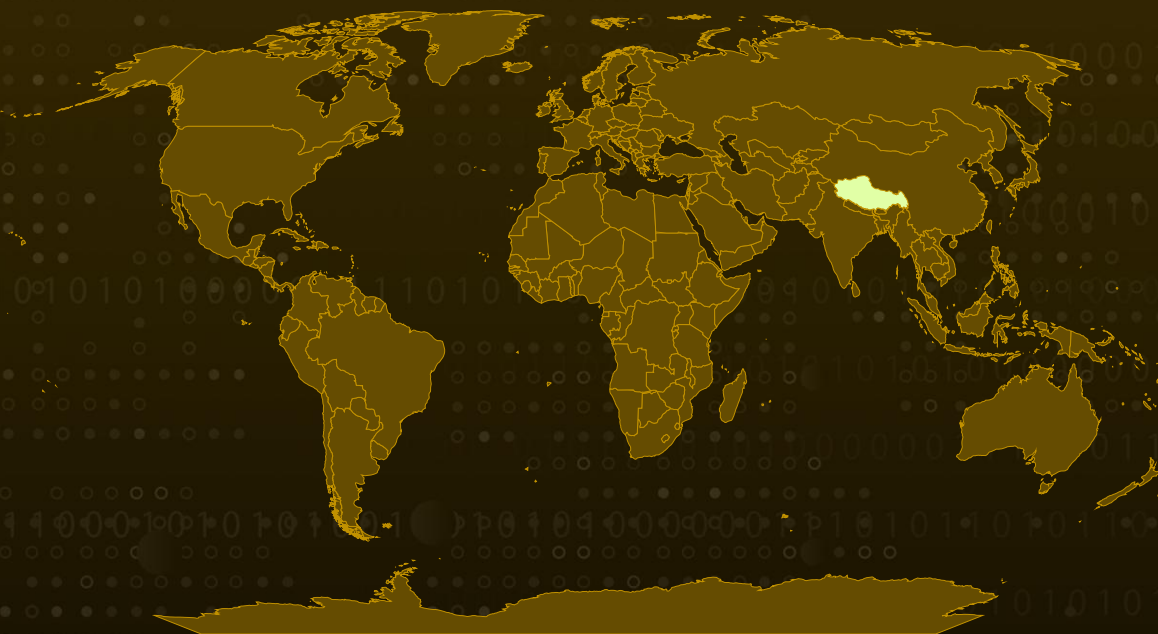

Targeted Region: Tibet

Malware: Ghost RAT, PhantomNet (SManager)

Campaign: Operation GhostChat and Operation PhantomPrayers

Attack: In June 2025, cyber attackers linked to China ramped up espionage campaigns against the Tibetan community, especially around the Dalai Lama's 90th birthday. Disguising malware as chat apps and prayer tools, the attackers tricked users into downloading trojanized software from fake websites designed to look legitimate. These malicious tools secretly installed malware like Ghost RAT and PhantomNet, giving the attackers control over victims' devices. The campaigns dubbed Operation GhostChat and Operation PhantomPrayers used clever social engineering, fake GUIs, and tailored malware to gather sensitive information and maintain long-term surveillance, highlighting a calculated attempt to exploit trust and community sentiment for political spying.

Attack Details

#1

In June 2025, a wave of sophisticated cyberattacks targeted the Tibetan community, timed strategically around the Dalai Lama's 90th birthday to exploit heightened online activity. Two distinct campaigns, Operation GhostChat and Operation PhantomPrayers were identified and attributed to China-linked APT groups.

#2

In Operation GhostChat, attackers hijacked a legitimate Tibetan community website that originally invited users to send birthday greetings to the Dalai Lama. Instead of reaching the original page, visitors were redirected to a spoofed domain that mimicked the look and feel of the legitimate site. The fake page encouraged users to download what appeared to be a secure, encrypted messaging app to chat with other community members. However, the download was a trap: it led to a trojanized version of the popular Element chat app bundled in a ZIP file named TBElement.zip.

#3

Once opened, this file contained both legitimate components and a maliciously modified ffmpeg.dll library. This DLL acted as the entry point for the malware, initiating a multi-stage infection chain. First, it loaded shellcode that stealthily injected itself into a system process. This was followed by a reflective loader designed to evade antivirus detection using NRV2D compression. Finally, the Ghost RAT backdoor was deployed capable of remote spying, file theft, and system control communicating silently with its command-and-control (C2) server via a binary TCP protocol.

#4

The campaign also embedded surveillance tactics directly into the malicious website. JavaScript code harvested users' IP addresses and browser details, while WebRTC functionality exposed real-time IP data, all silently transmitted to a script on the attacker's server.

#5

Simultaneously, a separate but related campaign, Operation PhantomPrayers, leveraged similar techniques but with new delivery mechanisms. Victims were lured with a seemingly spiritual application disguised as a "special prayer check-in" tool, hosted on malicious domain. The application, built using Python tools featured a polished interface displaying an interactive map of other supposed participants adding a layer of social credibility. Users were asked to input personal details, which were then sent back to the attackers.

#6

This application deployed a second-stage loader that decrypted and executed a variant of the PhantomNet backdoor. This malware was configured to communicate over TCP or HTTPS, using AES encryption for its C2 traffic. It also featured advanced capabilities such as plugin-based functionality and time-based execution though in this instance, timed execution was not activated. Together, these two campaigns showcase a targeted, calculated effort by state-sponsored threat actors to infiltrate and monitor the Tibetan community.

Recommendations

Be cautious of links on community websites: Always double-check the web address (URL) before clicking any link, even if it's on a site you trust. Attackers can replace legitimate links with malicious ones that look similar.

Avoid downloading unfamiliar software: Even if it looks community-related Don't install applications or tools like "chat" apps or "check-in" tools unless they come from official sources. Malware is often hidden in seemingly helpful programs.

Use VPNs and secure messaging platforms: Communicate using well-known, vetted encrypted apps, and use a VPN to protect your online identity and location.

Enhance Endpoint Protection: Deploy next-generation antivirus (NGAV) and endpoint detection & response (EDR) solutions to identify and block malware. Leverage behavioral analysis and machine learning-based detection to spot suspicious activity.
