# THREAT ADVISORY

 **ATTACK REPORT**

## **kkRAT Malware Campaign Targeting Chinese-Speaking Users**

Date of Publication

September 12, 2025

Admiralty Code

A1

TA Number

TA2025280

# Summary

**First Seen:** May 2025

**Targeted Country:** China

**Malware:** kkRAT, ValleyRAT, FatalRAT

**Affected Platform:** Windows

**Attack:** kkRAT is a newly discovered remote access trojan active since May 2025, distributed through phishing pages disguised as software installers. It employs strong anti-analysis techniques, privilege escalation, and BYOVD methods to evade detection and disable security tools. The malware achieves persistence via scheduled tasks, registry changes, and startup shortcuts. Its plugin-based design enables remote control, system discovery, proxying, and clipboard hijacking to steal cryptocurrency.

# Attack Details

## #1

kkRAT is a recently identified remote access trojan (RAT) first seen in a campaign targeting Chinese-speaking users since May 2025. The campaign lures victims with phishing pages that impersonate popular software installers (hosted on GitHub Pages) and delivers one of several payloads, ValleyRAT, FatalRAT, or kkRAT, via ZIP archives containing malicious executables.

## #2

The initial loader applies multiple anti-analysis measures, including timing and hardware checks for sandbox/VM detection, obfuscated API resolution and string decoding, and manipulation of Windows process/registry structures to frustrate automated analysis. Once executed, the malware attempts to escalate privileges and can temporarily disable network adapters to interfere with endpoint communications.

## #3

The operators employ a Bring-Your-Own-Vulnerable-Driver (BYOVD) approach to neutralize security product callbacks by exploiting a known vulnerable driver, then remove or disrupt security processes at user level. Persistence mechanisms observed include scheduled tasks, registry run-key modifications, and shortcuts placed in startup locations so the payload survives reboots and user logons.

## #4

The kkRAT payload is modular and plugin-driven, it fingerprints the host (OS and hardware details, network configuration, peripheral presence, and installed security software), then communicates with command-and-control servers using a zlib-compressed, XOR-obfuscated protocol.

## #5

Available plugins provide remote desktop/control, shell and process management, network enumeration and proxying (including SOCKS5), and clipboard monitoring that can substitute cryptocurrency wallet addresses with attacker-controlled values. The campaign's design emphasizes stealth, modularity, and monetization-focused capabilities.

# Recommendations

**Immediate containment & network controls:** Block and monitor the malicious domains, GitHub Pages accounts, and C2 endpoints listed in the report at the edge (proxy/web filter and perimeter firewall). Prioritize any IP:port combinations used for C2 and the download hosts for 2025.bin / output.log records.

**Harden privilege and driver controls:** Restrict who can install drivers or run elevated installers, and enforce least privilege for standard users. Where possible, block installation of unsigned or known-vulnerable drivers at policy level. These controls reduce the ability of attackers to use BYOVD techniques.

**Strengthen Email Security and User Awareness:** Ensure that email gateways are configured to detect and quarantine spear-phishing messages with encoded script attachments. Implement attachment filtering to block high-risk file types, and use URL sandboxing for links embedded in contract-themed lures. Conduct regular phishing simulation exercises to increase user awareness of socially engineered messages designed to impersonate business communications.

**Network Segmentation and Traffic Control:** Segment high-value systems from general user networks to limit lateral movement. Apply strict firewall policies to block outbound traffic to known kkRAT command-and-control domains. Inspect DNS logs and network telemetry for anomalous connections or encrypted data flows originating from suspicious processes or hosts.
