M ATTACK REPORT

MuddyWater Deploys Phoenix Backdoor in Targeted Espionage Campaign

Date of Publication

October 23, 2025

Admiralty Code

A1

TA Number

TA2025322

Summary

First Seen: August 17, 2025

Targeted Region: Middle East and North Africa (MENA)

Targeted Platform: Windows

Malware: Phoenix Backdoor v4, FakeUpdate Loader, Chromium Stealer

Targeted Industries: Government, Diplomatic, Foreign Affairs Ministries and Consulates,

Telecommunications, International Organizations

Threat Actor: MuddyWater (aka Seedworm, TEMP.Zagros, Static Kitten, Mercury, TA450, Cobalt

Ulster, ATK 51, T-APT-14, ITG17, Mango Sandstorm, Boggy Serpens, Yellow Nix)

Attack: MuddyWater, an Iran-linked APT group, launched a phishing campaign targeting over 100 government and critical infrastructure across the Middle East and North Africa. Using compromised emails and malicious Word files, it deployed the Phoenix backdoor and other tools for espionage. By blending custom malware with legitimate RMM utilities, the group enhanced stealth and persistence, underscoring the need for stronger email and endpoint defenses.

X Attack Regions

Attack Details

#1

MuddyWater, an Iranian-aligned Advanced Persistent Threat (APT) group linked to Iran's Ministry of Intelligence and Security (MOIS), has recently executed a sophisticated cyber-espionage campaign targeting over 100 organizations, primarily in the Middle East and North Africa (MENA) region. Their targets include embassies, diplomatic missions, foreign ministries, international organizations, and critical infrastructure entities. The campaign is focused on intelligence collection rather than disruption, reflecting the group's strategic espionage objectives.

#2

The attack begins with highly convincing phishing emails sent from a compromised mailbox accessed via NordVPN, increasing trust and bypassing conventional email defenses. Emails include Microsoft Word attachments that prompt recipients to enable macros. When enabled, embedded Visual Basic for Applications (VBA) code executes, initiating the first stage of the infection chain.

#3

The infection proceeds through a multi-stage payload deployment. The VBA macro installs a custom loader, FakeUpdate, which decrypts and injects the second-stage payload into its process. This final payload is the Phoenix backdoor version 4, which establishes persistence, registers the host with a Command-and-Control (C2) server, and continuously beacon for remote commands. This enables ongoing data collection, credential harvesting, and post-exploitation operations.

#4

In addition to Phoenix, MuddyWater deploys a custom credential-stealing tool, Chromium_Stealer, disguised as a benign application to exfiltrate login credentials from popular browsers such as Chrome, Edge, Opera, and Brave. The group also integrates commercial Remote Monitoring and Management (RMM) tools, including PDQ RMM and Action1, blending legitimate software with custom malware to enhance stealth, maintain persistent access, and complicate detection and forensic analysis.

#5

Since at least 2017, <u>MuddyWater</u> has evolved its tradecraft, using spear-phishing, exploitation of Microsoft Exchange and SharePoint, and living-off-the-land techniques. Organizations should disable macros, deploy EDR, monitor networks, and block known C2s like screenai[.]online. Threat intelligence sharing and preparedness are essential to mitigate this persistent state-sponsored threat.

Recommendations

Disable Macros by Default: Configure Microsoft Office to disable macros by default to prevent execution of malicious scripts. Only allow macros from trusted and verified sources to minimize risk. Educate users on the dangers of enabling macros in unsolicited emails.

Deploy Endpoint Detection and Response (EDR): Use advanced EDR solutions capable of detecting abnormal script executions and unauthorized registry changes. Monitor for known malware behaviors, including Phoenix backdoor and Chromium Stealer activity. Ensure centralized logging for efficient detection and incident response.

Conduct Phishing Awareness Training: Regularly train employees to identify sophisticated spear-phishing attempts and suspicious attachments or links. Emphasize verifying sender legitimacy before opening embedded content. Simulated phishing exercises can reinforce learning and improve vigilance.

Enforce Multi-Factor Authentication (MFA): Require MFA on all critical access points including VPN, remote management tools, and cloud services. This limits unauthorized access even if credentials are compromised. Regularly review permissions and revoke unnecessary or outdated access rights.

Browser Credential Defense: Implement a policy to prohibit saving corporate credentials in web browsers to nullify the effectiveness of the custom Chromium_Stealer tool.
