THREAT ADVISORY

ACTOR REPORT

Prince of Persia APT Campaigns Across Iran, Europe, and Beyond

Date of Publication

December 23, 2025

Admiralty code

A1

TA Number

TA2025387

Summary

First Seen: 2007

Threat Actor: Prince of Persia (alias Infy, Operation Mermaid, APT-C-07)

Malware: Foudre, Tonnerre

Targeted Countries: Iran, Iraq, Turkey, India, Canada, Albania, Andorra, Austria, Belarus, Belgium, Bosnia and Herzegovina, Bulgaria, Croatia, Czechia, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Kosovo, Latvia, Liechtenstein, Lithuania, Luxembourg, Malta, Moldova, Monaco, Montenegro, Netherlands, North Macedonia, Norway, Poland, Portugal, Romania, Russia, San Marino, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, United Kingdom, Vatican City

Targeted Industries: Critical Infrastructure, Telecommunication, Government, Private Sector, Media

Actor Details

#1

Prince of Persia, also known as Infy, is among the longest-running Iranian advanced persistent threat groups, with operations traced back to 2007. Multiple assessments attribute the group with high confidence to state sponsorship, acting in alignment with Iranian government interests.

#2

The group's early activity targeted victims in Iran and parts of Europe, establishing a foundation for long-term cyber-espionage. After several quiet years, Prince of Persia resurfaced in 2017 with a new malware family called Foudre, marking a renewed and more refined operational phase.

#3

Its campaigns rely on a two-stage malware architecture. Initial access is typically achieved through phishing emails that deliver Foudre, a downloader and system profiler. Foudre then deploys a secondary implant, Tonnerre, designed to extract sensitive data from selected high-value systems.

#4

Multiple active variants of both tools operate simultaneously, each using distinct domain generation algorithms to maintain a resilient command-and-control infrastructure across several servers. Recent iterations show further evolution. Tonnerre version 50 redirects communications through a Telegram group controlled by a bot, likely leveraging the Telegram API to issue commands and receive exfiltrated data.

#5

This shift reflects a move toward blending malicious traffic with legitimate platforms to reduce detection. Prince of Persia has a history of politically motivated operations. As early as 2010, the group compromised news websites linked to Jundallah, exploiting ActiveX vulnerabilities to infect site visitors. Activity intensified around the 2013 Iranian presidential elections, with a focus on Persian media outlets.

#6

In its most recent campaigns, the group has conducted covert operations across Iran, Iraq, Turkey, India, Canada, and several European countries. These attacks used updated versions of Foudre and Tonnerre, with the latest Tonnerre variant detected in September 2025. Delivery techniques have also shifted, replacing macro-based Excel documents with files embedding executables to install Foudre, reinforcing the group's continued adaptation and persistence.

Actor Group

NAME	ORIGIN	TARGET COUNTRIES	TARGET INDUSTRIES
Prince of Persia (alias Infy, Operation Mermaid, APT-C-07)	Iran	Iran, Iraq, Turkey, India, Canada, Albania, Andorra, Austria, Belarus, Belgium, Bosnia and Herzegovina, Bulgaria, Croatia, Czechia, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Kosovo, Latvia, Liechtenstein, Lithuania, Luxembourg, Malta, Moldova, Monaco, Montenegro, Netherlands, North Macedonia, Norway, Poland, Portugal, Romania, Russia, San Marino, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, United Kingdom, Vatican City	Critical Infrastructure, Telecommunication, Government, Private Sectors, Media
	MOTIVE		
	Information theft and espionage		

Recommendations

Harden Email and Document-Based Entry Points: Prince of Persia primarily gains initial access through phishing emails and weaponized Office documents. Enforce strict email filtering, block embedded executables, restrict document execution, and use attachment sandboxing. These controls directly reduce the success of Foudre-based delivery and initial compromise.

Implement Network Segmentation and Robust Access Controls: Isolate critical infrastructure and sensitive data from general user networks using network segmentation. Enforce strict access control lists (ACLs) to regulate traffic flow between segments, minimizing the potential for lateral movement during a security breach.

Detect and Disrupt Command-and-Control Infrastructure: Monitor for DGA-based DNS activity, anomalous outbound traffic, and suspicious use of messaging platforms such as Telegram. Focus on identifying abnormal DNS patterns, unexpected API usage, and unauthorized external connections to disrupt C2 communication and limit persistence and data exfiltration.
