THREAT ADVISORY

 **ATTACK REPORT**

OysterLoader Threat Model: Silent, Signed, Systematic

Date of Publication

February 19, 2026

Admiralty Code

A1

TA Number

TA2026048

Summary

First Seen: September 2023

Targeted Regions: Global

Targeted Platforms: Windows

Targeted Products: PuTTY, WinSCP, Google Authenticator, Microsoft Teams, Google Chrome

Targeted Industries: Technology, IT

Malware: OysterLoader (aka Broomstick, CleanUp, CleanUpLoader)

Attack: OysterLoader, a sophisticated multi-stage malware loader, continues evolving in 2026 with enhanced obfuscation and C2 methods. It primarily spreads via malvertising campaigns, redirecting users to fake download sites for popular software. The loader, signed with valid certificates from legitimate companies, installs malicious payloads like Rhysida ransomware and Vidar infostealer. Since its initial discovery, OysterLoader has undergone sustained development with updated C2 endpoints, obfuscation methods, and fingerprinting schemas, signaling active and committed threat actor operations.

Attack Details

#1

OysterLoader, a sophisticated multi-stage malware loader, continues to evolve into 2026, refining its command-and-control (C2) infrastructure and obfuscation methods. Written in C++, it serves as a delivery mechanism for ransomware payloads like Rhysida and commodity malware such as Vidar infostealer. The loader primarily spreads through malvertising campaigns, exploiting search engine results to direct users to counterfeit websites posing as legitimate download portals for software such as Microsoft Teams, Google Chrome, PuTTY, and WinSCP. These fraudulent sites use typosquatted domains, to deceive victims. The malicious installers, signed with valid Authenticode certificates from companies to further enhance the illusion of authenticity. OysterLoader's distribution methods have also expanded through integration with the Gootloader malware framework, broadening its initial access vectors.

#2

Upon execution, the malware initiates a four-stage infection process. The first stage, TextShell, employs API call flooding-hundreds of legitimate Windows DLL calls, including GDI functions-to evade heuristic detectors, confuse sandboxes, and hinder reverse engineering. It also checks for debuggers using methods like IsDebuggerPresent, trapping execution in infinite loops if detected. The packer dynamically resolves critical API functions through custom hashing, making signature detection difficult.

#3

The third stage serves as an intermediate downloader, validating the environment, creating a mutex to prevent duplicate instances, and establishing communication with C2 servers. The C2 protocol has evolved from a simple two-endpoint model to a more complex three-step process. This begins with an empty GET request, followed by a system fingerprint submission, and ends with dynamic beaconing to new endpoints.

#4

In the fourth stage, OysterLoader ensures persistence and prepares for payload delivery. It drops a DLL into the %APPDATA% or Temp directory and creates a scheduled task, ClearMngs, to execute the DLL via rundll32.exe at intervals ranging from 13 minutes to three hours. Additionally, it uses Registry Run Keys for persistence.

Recommendations

Block Unsigned and Untrusted MSI Installers: Configure endpoint protection policies to prevent execution of MSI files that are not signed by verified, trusted publishers. Implement application whitelisting to restrict software installation to approved sources only.

Monitor for Suspicious Scheduled Task Creation: Deploy detection rules to alert on the creation of scheduled tasks that invoke rundll32.exe to load DLLs from user-writable directories such as %APPDATA% and %TEMP%. Specifically monitor for task names matching known patterns like ClearMngs.

Detect Anomalous API Call Patterns: Tune endpoint detection and response (EDR) solutions to identify processes exhibiting high volumes of GDI and system API calls that are inconsistent with their declared purpose, which may indicate API flooding obfuscation techniques.

Enforce TLS Inspection for Outbound Traffic: Implement TLS inspection on egress traffic to identify custom HTTP headers, non-standard user-agent strings, and anomalous Base64-encoded payloads characteristic of OysterLoader C2 communications.

Hunt for Known Mutex Values: Conduct threat hunting across the enterprise for the creation of mutex objects matching known OysterLoader patterns, such as ITrkfSaV-4c7KwdfnC-Ds165XU4C-IH6R9pk1, to identify potentially compromised endpoints.

Restrict Rundll32 Usage: Implement policies to monitor and restrict the use of rundll32.exe for loading DLLs from non-standard or user-writable locations. Alert on any rundll32.exe invocations referencing DLLs in %TEMP%, %APPDATA%, or other suspicious paths.

Potential MITRE ATT&CK TTPs

Tactic	Technique	Sub-technique
Resource Development	<u>T1583</u> : Acquire Infrastructure	<u>T1583.001</u> : Domains
Initial Access	<u>T1189</u> : Drive-by Compromise	
Execution	<u>T1204</u> : User Execution	<u>T1204.002</u> : Malicious File
	<u>T1059</u> : Command and Scripting Interpreter	<u>T1059.001</u> : PowerShell
	<u>T1106</u> : Native API	
	<u>T1129</u> : Shared Modules	
Persistence	<u>T1053</u> : Scheduled Task/Job	<u>T1053.005</u> : Scheduled Task
	<u>T1547</u> : Boot or Logon Autostart Execution	<u>T1547.001</u> : Registry Run Keys / Startup Folder
Defense Evasion	<u>T1027</u> : Obfuscated Files or Information	<u>T1027.007</u> : Dynamic API Resolution
		<u>T1027.002</u> : Software Packing
	<u>T1140</u> : Deobfuscate/Decode Files or Information	
	<u>T1553</u> : Subvert Trust Controls	<u>T1553.002</u> : Code Signing
	<u>T1218</u> : System Binary Proxy Execution	<u>T1218.007</u> : Msiexec
	<u>T1497</u> : Virtualization/Sandbox Evasion	<u>T1497.001</u> : System Checks
